

UX Case Study – Healthcare Mobile App for Elderly Patients

Scenario Overview

Designing a healthcare mobile application that helps elderly users book doctor appointments, track medicines, and access medical reports easily.

1. Identifying and Writing Problem Statements

User Pain Points

- Complex app navigation
- Small text and unclear buttons
- Difficulty booking appointments online
- Forgetting medicine schedules
- Dependence on family members for digital tasks

UX Problem Statements

1. Elderly patients need a way to book doctor appointments easily because current healthcare apps are difficult to navigate, which results in missed consultations and frustration.
2. Senior citizens taking multiple medications need a way to receive simple medicine reminders because they often forget dosage timings, which results in health risks and improper treatment.

2. Identifying Appropriate Research Methods

Research Method	Purpose	Justification
User Interviews	Understand user difficulties and expectations	Helps gather detailed feedback from elderly users.
Usability Testing	Observe users interacting with the app	Identifies navigation and accessibility issues.
Surveys	Collect feedback from many users	Useful for identifying common healthcare app problems.
Contextual Observation	Study users in real-life environments	Reveals practical challenges faced while using the app.

Elderly users often face accessibility and usability challenges while using mobile applications. Interviews and usability testing provide deeper insights into navigation difficulties, readability issues, and digital confidence levels. Surveys help gather broader feedback from multiple users.

3. Creating Personas

Persona 1 – Lakshmi Raman

Demographics

- Age: 67
- Occupation: Retired Teacher
- Location: Chennai, India
- Technology Level: Beginner

Goals

- Book doctor appointments independently
- Receive medicine reminders
- Read medical reports easily

Behaviors

- Uses smartphone mainly for calls and WhatsApp
- Avoids complicated applications
- Prefers large buttons and simple navigation

Pain Points

- Small text is difficult to read
- Gets confused by multiple menu options
- Frequently forgets passwords

Motivation

- Wants independence in managing her health
- Does not want to depend on family members

Persona 2 – Ravi Kumar

Demographics

- Age: 45
- Occupation: Software Engineer
- Location: Bengaluru, India
- Technology Level: Intermediate

Goals

- Monitor parents' health remotely
- Schedule doctor appointments quickly
- Track medicine usage

Behaviors

- Uses healthcare apps regularly
- Prefers notifications and automation

- Frequently accesses reports digitally

Pain Points

- Difficult to coordinate appointments for parents
- Existing apps lack family health tracking

Motivation

- Wants better healthcare management for his parents
- Seeks convenience and time-saving solutions
